

## COP2073C Programming Assignment 6

### Instructions

- Improve the solution to the Module 6 practice exercise by doing the following:
- Replace the for loop in the custom function with a vectorized operation
- Add a try block to the function which handles the exception if one of the parameter elements is non-numeric
  - If the exception is thrown, return a vector of NAs
- A try block looks like this:

```
    assign try result to temp variable
    temp variable <- try ((vectorized operation), silent=T) # Silent to
    prevent error messages
    if (class(temp variable) == "try-error")
        ...
    else
        ...
```

- In your test, change the direct call to the function with one of the apply functions (try them all to see which works best)
- Add a second test with a numeric vector that also includes a string element to test your exception handler
- Non-Functional Requirements:
  - Include a 4-line ID header at the beginning of your script.
  - Include vertical spacing (a blank line) between logical blocks for readability.
  - Comment your code thoughtfully (avoid excessive commenting).
  - Ensure each line of code does not exceed 80 column
